                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                are used to screen for agents (e.g. antibodies) that are capable of inhibiting or blocking the binding of an IL-1-R intracellular ligand to the intracellular domain of IL-1-R, i.e. inhibitors of IL-1 activity. Such agents can be used to treat inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAW19992 represents human calcium activated neutral protease (CANP). This protein was found to have an area of high homology with an interleukin-1 receptor (IL-1-R) intracellular ligand (encoded by cDN) clone 14w, see AAT71218) and thus will display some of the same properties of this protein. IL-1-R intracellular ligand proteins are used to screen for agents (e.g. antibodies) that are capable of inhibiting or blocking the binding of an IL-1-R intracellular ligand to the intracellular domain of IL-1-R, i.e. inhibitors of IL-1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes the novel spatial structure of human and rat neutral calcium-activated cystein protease (calpain) family. The spatial structure (especially crystalline forms) are used for structure-function studies, particularly for identifying (pseudo)substrates, inhibitors and activators of calpains, potentially useful for treatment of ischemic conditions, muscular dystrophy and/or tumors. The products of the invention have anti-ischemic, muscular and antitumor activity. This sequence represents the human calpain 80kDa subunit described in the
Human: calpain; nervous system disorder; amyotrophic lateral sclerosis; Parkinson's disease; dementia; genito-urinary system disorder; stroke; Alzheimer's disease; multiple sclerosis; benign prostate hyperplasia; urinary incontinence; gene therapy; cytostatic; nootropic; uropathic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes the novel spatial structure of human and rat neutral calcium-activated cystein protease (calpain) family. The spatial structure (especially crystalline forms) are used for structure-function studies, particularly for identifying (pseudo)substrates, inhibitors and activators of calpains, potentially useful for treatment of ischemic conditions, muscular dystrophy and/or tumors. The products of the invention have anti-ischemic, muscular and antitumor activity. This sequence represents the rat calpain 80kDa subunit described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Spatial structures containing calpain-derived polypeptides, useful for identifying calpain modulators and substrates, potentially useful e.g. {\rm c}

The invention relates to a complex of protein-protein interactions to between a Shigella flexmeri polypeptide (e.g. ospb), ospb1, ipaC, ipaH9, 8, ospG and ospC1) and a mammalian polypeptide defined in the specification. The complexes are formed using the yeast two-hybrid system. Also included are (1) a recombinant host cell expressing the interactions between the shigella flexneri polypeptide and a mammalian polypeptide and a mammalian polypeptide defined in the specification; (2) selecting a modulating compound that inhibits or activates the protein-protein interactions; (3) a modulating compound obtained from the method of (2); (4) a SID (selected interacting domain) polypeptide or its fragment or variant comprising the human polypeptides appearing as ABG70042-ABG770242; (5) a SID polynucleotide or its fragment comprising (5); or encoding the above polypeptides a vector comprising (5) a recombinant host cell containing the vector; and (10) a protein of the interaction of the component of the vector of the component of the com
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chip comprising Shigella flexneri polypeptide and a mammalian polypept defined in the specification. A pharmaceutical composition comprising compound, polypeptide or polynucleotide is useful for treating or preventing shigellosis (bacillary dysentery) in a human or mammal. The present sequence represents a human prey protein isolated by the yeast two-bybrid assay, forming a complex of the invention with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 7;

The polynucleotides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases, hyperproliferative disorders, cardiovascular disorders, cerebrovascular disorders, anglogenesis, nervous system

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 homologous to them, which are given in the exemplification of the prese invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include:
                                                                             Sequence
                                                                                                                                                                         primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservat:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       human secreted proteins given in AAB51620 to AAB51668. AAB51669 to AAB51722 represent human secreted polypeptide sequences and protein homologous to them, which are given in the exemplification of the

neuroprotective; antibacterial; virucide; fungicide; and ophthalmological. The polynucleotides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases, hyperproliferative disorders, cardiovascular disorders, cerebrovascular disorders, anglogenesis, nervous system
                                                                                                                      and cells the genes are expressed in Examples of activities include: antiarthritic; immunosuppressive; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; noctropic; neuroprotective; antibacterial; virucide; fungicide; and
                                                                                                                                                                                     AAB51722 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues

inhibition, significant decrease in their response latency to the hot plate test or a decreased response threshold to metrazol. Agents that modulate the expression, function or activity of the target gene are useful for treating a disorder associated with a mutation in tryptase gene or in limulus clotting factor protease-like gene. The transgenic animals are useful for testing the efficacy of proposed genetic and pharmacological therapies for human genetic diseases. They are useful as models for diseases, disorders or conditions associated with pharmaceuticals, therapies and interventions which may be effective in the pharmaceuticals, therapies and interventions which may be effective in the pharmaceuticals, therapies and interventions which may be effective in the pharmaceuticals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to non-human transgenic animals preferably transgenic mice comprising disruption in target gene such as tryptase gene. The invention also relates to compositions and methods relating to the characterisation of gene functions. The transgenic animals are useful for identifying an agent that modulates the expression or function of a target. They are useful for identifying an agent that modulates a

disorders; neurological disorders; gastrointestinal disorders; transport disorders; and connective tissue disorders. They may also be used to screen for modulators of protein activity or gene expression. DITHP proteins can additionally be used in analysis of the proteome of a tissue or cell type and to induce antibodies. The dithp nucleic acids are additionally useful in somatic or germline gene therapy of the disorders mentioned above, as a source of antisense sequences, as a source of probes and primers, in genotyping and identification of individuals, in probes and primers, in genotyping and identification of individuals, in
                                                                                                                                                                                                         proteins; microarrays comprising dithp nucleic acid sequences; methods of detecting dithp nucleotide and protein sequences; methods of screening for compounds which specifically bind a DITHP protein; and methods of assessing the toxicity of test compounds using a dithp hybridisation probe. Dithp nucleic acid sequences and DITHP proteins may be used in the diagnosis of a wide variety of conditions including cancer and other cell proliferative disorders; autoimmune or inflammatory disorders; bacterial, viral, fungal or parasitic infections; hormonal disorders; metabolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            identifying test compound which encoded by human diagnostic and induce antibodies
                                                                                                                                                                                                                                                                                                                                                                 sequences of the invention; recombinant vectors, host cells and transgenic organisms comprising a dithp nucleic acid sequence; the recombinant production of DITHP proteins; antibodies specific for DITHP
                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to novel human diagnostic and therapeutic polynucleotides designated dithp (ACC46080-ACC46749) and to their encoded proteins (DITHP; ABR41136-ABR41812). The invention also relates to polynucleotide sequences at least 90% identical to the dithp cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 27; SEQ ID No 1058; 591pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel human diagnostic and therapeutic polypeptide useful for identifying test compound which specifically binds to a polypeptide incoded by human diagnostic and therapeutic polynucleotide, and to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel human proteases and polynucleotides encoding the proteases, useful for treating, diagnosing or preventing cell proliferative, cardiovascular, autoimmune/inflammatory, neurological and developmental
                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human proteases (PRTS1-14) and its corresponding CDNA molecules. Human PRTS and its nucleic acid molecule are useful for the diagnosis, treatment and prevention of disorders associated with increased or decreased expression of PRTS. Examples of such disorders

                                                                                                                                                                                              polypeptide (I) and polynucleotide (II) encoding (I). (I) may be used to screen for substances (S) that may modulate its activity. Administering S (which modulates protease activity in vitro) may be used to treat a disease or disorder selected from cancers (e.g., of tissues, of blood or haematopoletic origin, of the breast, colon, lung, prostrate, cervical, brain, ovarian, bladder or kidney), immune-related diseases and disorders, cardiovascular disease, brain or neuronal-associated diseases (e.g., central or peripheral nervous system diseases, migraine, pain, sexual dysfunction, mood disorders, attention disorders, cognition disorders, hypotension, hypertension, psychotic disorders, neurological disorders and dyskinesias), metabolic disorders and inflammatory disorders such as those bowe. AAUTSAF6-AAUTS910 represent human protease among acid segmences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; protease; PCR primer; cytostatic; immunomodulator; cardiant; vasotropic; antimigraine; analgesic; endocrine; noctropic; tranquiliser; hypertensive; hypotensive; neuroleptic; neuroprotective; anabolic; anorectic; antiinflammatory; aspartyl protease; cysteine protease; metalloprotease; serine protease; cancer; haematopoletic; breast; colon; lung; prostrate; cervical; brain; ovarian; bladder; kidney; pain; immune-related disease; cardiovascular disease; neuronal disease; migraine; sexual dysfunction; mood disorder; attention disorder; cognition disorder; hypotension; hypertension; psychotic disorder; dyskinesia; metabolic disorder; inflammatory disorder.
